

Stardock Omega 31: Downloads

Created by Nytecode

Here you will find the link to download my Battlestations programs.

Requirements

It is written in Java so it will run on a variety of different computers but it does require a Java Virtual Machine (JVM) version 1.6 or newer to function. The applet below should show you what version of Java you likely have installed on your system. If it is older than 1.6, or a Java not found message is displayed, you will need to download Java.

Java not found. Please install from the link below before trying to run.

The JVM can be downloaded from <http://www.java.com/>.

Downloading

The latest versions can be downloaded from here:

- [BattlestationsTools.jar](#)
- [BattlestationsShipCreator.jar](#)

Some browsers may name it with a .zip extension. Just rename the file to < jar file name >.jar.

Running

Since I currently don't have a proper installer, on many computers, you will just need to double-click the file and it will run.

If that doesn't work, usually the command: `java -jar<jar file name>.jar` will work.

To Do

Installer

Help/how to

Better feedback (to indicate what is going on)

Automatic upgrade (something I've always wanted to write)

Way to add new modules
